

Easy Maintenance Keeps Your Tint Looking Brand-New for Life

- Simple care takes just minutes and ensures your LLumar/Vista film stays crystal-clear for decades.
- Cure Time takes 3–5 days (longer in cold/humid weather)
- No interior cleaning for a full 30 days
- Tiny water bubbles, cloudy haze, or “fingerprint” marks? 100% normal – trapped moisture/adhesive will evaporate and disappear on their own (never push or pick at them) If they persist please call us to review the install & make sure your tint job is up to industry standards for installation.
- Dust specks? Normal in every professional install – Older windows & doors have more dust specs due to the amount of debris trapped into the gaskets & seals, this is unavoidable for any installer. Wood frames are specifically at risk, especially older ones.
- After 30 days: clean only with ammonia-free solution (a couple drops baby shampoo + water) and soft microfiber cloth works great. Never use ammonia cleaners (Windex, 409, etc.), rough paper towels, brushes, or razor blades on the film.
- Exterior glass cleans exactly like normal. **Your tint is on the inside of your home in most every case unless a specific exterior applied film.**
